Firmware Releases

Release 1.9 (September 2015)

- improved read config for reduced startup time
- add support for E120, E112, E10 and E20
- restart stream/record after timing changed
- stop stream/record if no frames incoming
- switchable check functions (hotplug timing frames)
- add servo control for E12
- can receive mavlink messages and printout received information
- enable api/storage show root partition total and free count
- prevent "api/www" from creating a backup in root directory
- create a udp stream and add udp infos to "api/settings"
- add rs232 serial port controls
- add the ability to set add-on type by api-call
- add support for E120-W, E112-W, E10-W and E20-W
- · api/settings: add semi-automatic mode
- add the ability to program own hdcp key and hdcp bksv via api call
- fix for /data/media directory is not created at start
- set fourth LED on E120 controllable and switch power and fourth LEDs position
- api/record: stop record if USB stick is plugged out or run out of memory
- api/record: add ability to set minimal needed free for recording
- api/record: added programmable maximum size for recordings
- api/record: restart recording automatically after file went to large
- api/record: add ability to manual set record path and name
- api/rs232: add read api call
- api/rs232: add raw mode
- api/rs232: add programmable timeout and end sign
- api/rs232: fix latency calculation and prevent wrong camera settings from changing settings
- api/rs232: add sanity check and warning for baudrate settings
- add fixed frame rate for semi automatic mode
- add base mode for encoder settings

Release 1.8.307 (June 2015)

- create system.log mapped to http://<ip>/log
- change to umount -l (to force umount after a recording was done)
- fix JPEG capture (capture to /tmp/capture.jpg then copy to USB images directory)
- fix VSIZE max of 720 (now: 1080)
- allow initial color setting (/api/input post: action=save&color=x)
- change START= to TSTART= in config file (it replaced HSTART and VSTART)
- add INTERLACED to config file
- add usb=umount to /api/storage (this un-mounts the USB device)
- add heard beat to /api/system

- add fix for slow file transfer when 38116 is plugged
- add /api/rs232 (for control of Panasonic block camera, compute checksum and add 0xff)
- add hsize, vsize to /api/stream
- /api/event: capture images while streaming (not only while recording)
- /api/event: image sequence number across multiple recordings in event

Release 1.8.160 (March 2015)

- add software watchdog (timeout) with /api/timeout
- add watchdogTest to force timeout of watchdog
- add watchdog settings (including permanent save in config)
- · disable watchdog when upgrading firmware
- rename /api/addon and fix Ain bug
- fix field offset bug in 1080i30 (vic = 5)
- add watchdog refresh (20 seconds) so that the watchdog does not time out
- add setTime (POST request) to /api/addon
- add support for 38116-2 (control switches and LEDS via this module)
- video bandwidth default setting: allow up to 25000 kbit (before: 2500 kbit)
- fix 576p aspect ratio
- add control of aspect ratio this need to be made programmable with /api/settings POST
- add field offset to /api/settings
- fix /api/www copy
- 576p50: hstart=132 and vstart=44
- change hstart of 576i to 269
- fix 720x576i25 mode (field_offset in lua is now set correctly)
- · show aspect ratio and HDMI/HDCP status of video input
- add jpgQuality setting
- fix permanent save of audio settings
- fix initial setting of audio=analog (digital=0 in config file)

Release 1.8.83 (October 2014)

- fixed subnet mask permanent save
- added safe encoder mode (does not support 1080i/p)
- delete recordings
- support for W100 add-on module
- added statistics for streaming and recording

Release 1.8.3 (August 2014)

- PWM api added
- decoder web page enhanced

Release 1.8 (July 2014)

- web based GUI to exercise the API and to control the E110
- write custom EDID and configure programmable timer
- programmable text overlay (up to 8 strings with 24 characters each)
- timestamp overlay with frame counter
- profile selection: H.264 baseline, main or high

• decoder: play RTSP stream (720p and 1080i) - AAC audio and H.264 video

Release 1.3 (April 2014)

Initial release of the E110 firmware. Key features:

- default configuration in /data/bin/config
- analog audio support
- ntp time server support (UTC time zone) set date and time (Internet connection required)
- timer automatically schedule recording or streaming events
- automatically start recording or streaming after power up (set timer appropriately)
- DHCP support
- at boot up config file and startup.log (with IP address) are copied to USB memory device
- www_root file management und upgrade support
- log API calls

Known issues

- do not disconnect the video source while recording or streaming
- switch from decoder mode back to encoder mode requires cold reboot

System Control

The startup script /etc/init.d/99init initializes the functions of the E110. It sets the date and time through ntp and starts the core executable /data/bin/auvidea_enc which supervises and manages all functions of the E110 including the http request based API.

auvidea_enc

Initialize all hardware devices in the E110. The first 2 options have to be executed once after power up to initialize the hardware devices in the system.

Options:

- -i reset and init HDMI devices
- -a init analog audio
- e start normal operation

Telnet

For security reasons Telnet is disabled and should not be activated.

SSH

By default the root level access is disabled, to protect the system. Experienced users may request the admin password for the "admin" API call. This password allows to enable SSH access and the other functions of the admin interface. If you request the admin password for your system, you need to sign the warranty release agreement, as Auvidea can not longer guarantee the operation of the system. System operation is then the users full responsibility. Worst case, the system may become dysfunctional, the hardware may be damaged and a complete reflash may be required. At this time, only Auvidea can perform flashing of the system. Auvidea provides this as a service. Please contact us at <code>support@auvidea.com</code>. Please include a copy of the startup.log file, which the system copies to the USB devices at boot up time.

Please note, that the root level access will not allow you to port third party applications or custom software to the E110, as there is no C tool chain (a C compiler) installed. The system requires a custom cross tool chain. For customization we recommend to use the optional WLAN add-on module and install custom software on that module.

Web server

This is the main control interface with HTTP requests as described in the following sections. Also this web server may be used to serve standard html pages. They may be copied to the www_root directory with the "www" API calls. The web server supports no server side processing such as PHP or JSP. Please contact us, if you would require more features. Optionally a regular web server (lighttpd) could be activated.

FTP

FTP is disabled by default.

Default settings

```

```

This startup script initializes the functions of the E110. It sets the date and time through ntp and start the core executable /data/bin/auvidea_enc which supervises and manages all functions of the E110 including the http request based API. This script file is copied to the USB memory device, if one is inserted at bootup time.

Auto start

The timer is disabled by setting both TIMERMODE to "0". To start streaming immediately after power up, set START="0", "DURATION"="0" and TIMERMODE="1".

"CROP_LEFT" and "CROP_TOP" are the cropping parameters.

Encoder Settings

Default settings

The default settings allow to stream a 16:9 video source such as the 1280x720p60 video from an Apple iPad mini (HDMI video via Apple AV adapter) at the original resolution of 1280x720 with 60 fps. It is recommended to lower the frame rate to 30 fps by setting "fps_divide=2".

Low bandwidth

At low bandwidth settings it it recommended to increase the GOP size from 16 to a higher value. A GOP size of 16 indicates that an i-frame is generated every 16 frames. As a rule of thumb, the i-frame is approximately 10 .. 20 times larger than a P or B frame. So a larger GOP size uses the bandwidth available more efficiently. Please note that the GOP size may be dynamically changed while encoding to adjust the encoder to a lower or higher bandwidth available on the uplink channel.

4:3 video of a 16:9 source

The iPad has a 4:3 display. If this 4:3 video is encapsulated in the 720p output (1280x720) the active video is surrounded on the left and right by black borders. These borders may be cropped of for recording or streaming. The horizontal size of the 4:3 video window with 720 vertical lines is: 720 / 3 * 4 = 960. So (1280 - 960) / 2 = 160 pixels must be cropped of on the left and the right. Please adjust "crop_left=160" to stream a 960x720 video. The complete POST string is: http://<ip-address>/api/settings?crop_left=160&width=960&hsize=960&autosize=0

Scaling

Videos may be scaled to a smaller or larger size. By setting the wrong aspect ratio, they may even be distorted. Example: the 960x720 video of the iPad should be reduced to half size (480x360):

crop_left=160&width=960&hsize=480&vsize=360&autosize=0

The top video image shows the scaled video from the iPad. Please note that the "width" must stay at 960 and the "height" at 720. If this is changed to 480 and 360, than the video will not be scaled. Instead the video is cropped and only a quarter of the source video is encoded. The second video is cropped down to 480x360 with no scaling:

960x720 video scaled down to 480x360

crop_left=160&width=480&height=360&hsize=480&vsize=360&autosize=0

media information of VLC player (Mac OS 10.9)

960x720 video cropped down to 480x360

RTSP Live Streaming

RTSP stream

The RTSP may be send to local players and servers. As it is a pull stream, it does not support sending the stream to public streaming servers on the Internet, as it cannot cross routers with NAT (network address translation).

If you need to stream to the Internet, please send the stream to a local protocol translator to convert the streaming protocol to RTMP or similar protocols. Please have a look at the Wowza server, VLC or FFMPEG for the protocol translation function. Also compact computers such as the Raspberry Pi may be used for protocol conversion or transmuxing.

Players

The RTSP stream may be played on the following players:

Quicktime 7

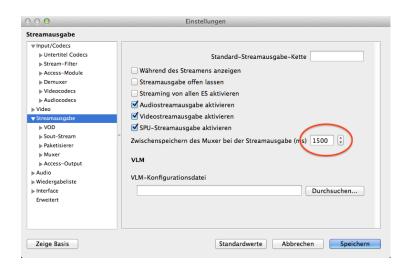

Version 7.6.6 (1709) tested ok

Quicktime 10

Version up 10.2 is ok. Version 10.3 (included in MacOS 10.9) does not play RTSP streams. It no longer falls back to the old QuickTime framework, so it will play just what AVFoundation can play. RTSP streaming is not supported.

VLC

Version 2.1.0 Rincewind (Intel 64 bit) tested ok (on Mac OS 10.9). Please change the buffer setting (default: 1500ms) to reduce the latency.

buffer settings in the VLC player (German version)

Stream Transmuxer

Transmuxer

A transmuxer converts one streaming protocol or video file to another stream protocol or video file. In the transmuxing process the video and audio are not decoded or encoded. The audio and video data is just repackaged. As no computing intensive software is involved, the transmuxing may be performed by little processing resources.

WLAN daughter module

The WLAN daughter module (38094) serves 3 main functions:

- 2.4 GHz WLAN interface with external antenna (RP-SMA)
- USB port for 3G/4G modems
- RTSP stream transmuxer into other streaming formats (38094-2 with micro SD card)

This module is based of the AR9331 processor and the openWRT operating system (a special Linux for routers). It features a 400 MHz MIPS processor, 64 MB memory, 16 MB Flash, an internal Ethernet port to the E110 (the RJ45 Ethernet connector on the E110 must not be populated), and an external WAN port (RJ45 connector).

openWRT supports a C cross tool chain (development platform), so custom code may be compiled and ported to this module. This is the perfect solution, if it is desired to support streaming formats other than RTSP and if custom software should be added to the E110.

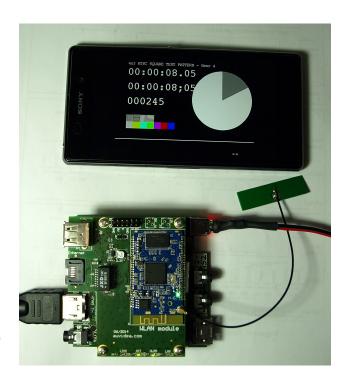

Schedule:

- first prototypes (38094): now
- production (38094-2): September 2014

The 38094 WLAN module is mounted on top of the E110 encoder module. The WLAN module features an U.FL antenna connector and comes with an U.FL to RP-SMA cable, so that any 2.4 GHz antenna may be used. The WLAN module is openWRT based and is configured with a web interface (LuCI).

The 12 pin header features 3 servo outputs and the TTL serial console interface to the WLAN module (AR9331 based).

38094-2 will feature 7 status LEDs located on the front of the board and an on-board micro SD reader for flash extension.

FFMPEG

FFMPEG

FFMPEG is a very versatile transcoder (video encoder and decoder) and transmuxer. It may be ported to various computing platforms and operating systems. For details please visit the site: http://www.ffmpeg.org

Transmuxer

A transcoder converts one video format (codec) to another format (codec). This is very compute intensive so it requires a high performance system. A transmuxer does not recode the audio or video, it just reformats the data. This is a task which only requires limited processing resources, so it may be performed on embedded systems with ARM or MIPS processors.

WLAN module

It is planned to port FFMPEG to the WLAN module.

Compiling FFMPEG

If possible please use a packet manager for your target system to install FFMPEG. Please use the latest release and insure that the required libraries for RTSP and RTMP are installed.

Sample console command

The following command receives an RTSP stream from the E110 and transmuxes it into an RTMP stream, which may be pushed across firewalls to a public server on the Internet.

ffmpeg -i rtsp://192.168.0.160:554/stream -c copy -f rtmp://<server ip address>/<pub point>

API

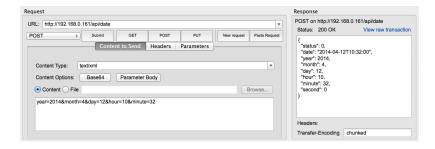

The API is HTTP request based and therefore very easy to use. With a simple GET request, internal parameters of the device may be retrieved. With a POST request parameters or commands may be passed to the device.

The GET requests may simply be send by any web browser just by entering the API call as an URL. Example: http://<ip-address>/api/date retrieves the date and time. POST requests my be send by HTML form elements and interactively by some web browser plugins. The web GUI features an API page, which lets you send any GET or POST requests to the system.

Below the Firefox browser and its "HttpRequester" are used to document a POST request. Just

enter the API URL in the field on the top left and the POST request string on the lower left. Any number of parameters may be specified. The delimiter is the "&" character.

The response is listed on the right formatted in the JSON format.

Firefox HttpRequester sends a POST request to the E110 API

This API is implemented in a very efficient manner with fast response time and little overhead. Many API requests execute in less than 100ms. All GET API requests have the following format: http://<ip-address>/api/<api call>.

Please note that the "options" must be send as POST request. Sending them with a GET request will not work. Please have a look at the HTML examples.

Feature enhancements

This is the description of the first release of the API. The API is still in development, so new features will be added frequently. These are the main features currently on the to do list:

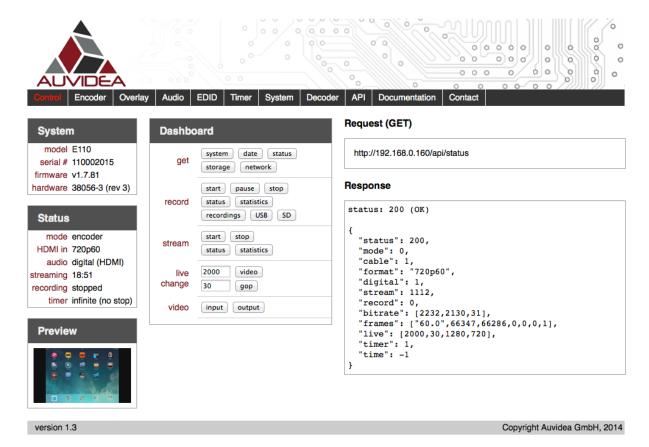

- · store and forward of the video files
- dual stream encoding
- audio only encoding

Please let us know, if you would like to recommend new features and functions.

Web based GUI

Web based GUI

The web based GUI allows to easily exercise almost all API functions. The navigation bar lets you navigate to the 8 pages: control, encoder, overlay, audio, EDID, timer, system and API.

Control

This is is master control panel. Here the main functions of the encoder (stream and record) and the decoder (play) may be started. Click on the "Status" or "Preview" bars to collapse the fields below. The JPG preview image is updated every 2 seconds. Click on the JPG image, to enlarge it to full size (1280x720 pixels). "live change" allows to change encoding parameters while streaming or recording.

Encoder

The video, encoding and stream settings of the encoder. Please use the "action=save" parameter, to save the settings permanently.

Overlay

Up to 7 text lines and a timestamp may be overlaid in the encoded video. No overlay on the loop through video and the decoded video are performed.

Audio

The audio control panel for setting various audio properties.

EDID

Read and write the EDID of the HDMI input.

Timer

Configure a single event timer, to start recording or streaming at a preset time and date. An infinite interval is supported by setting the duration to 0. Autostart is supported as well. Please see the timer page for details.

System

Network, date, www, and logging control.

Decoder

Play out an RTSP audio/video stream (H.264 video and AAC audio). With an E110 as encoder and an E110 decoder you can achieve a very low latency video transmission (typically: 70 .. 100 ms). With software decoders such as the OMX player on the Raspberry Pi or the VLC player to typically latency will be around 1 or 2 seconds. On the VLC player, the latency may be reduced, by reducing the buffer setting (default: 1500ms) in the settings dialog.

API

HTTP request page to send custom GET and POST requests interactively.

Customization of the GUI

All GUI files are located in the www directory. Please go to the www tab in the GUI and press the backup button in the www section. This copies the content of the internal www directory to the USB stick (www_backup/www). You can now modify any of the files. If you just would like to replace the Auvidea logo by a custom logo please replace the logo.png by your custom logo (default size: 980x116 pixel). It is referenced in style.css (#logo). If you would like to change the GUI itself please edit the index.html file.

Tabs can be changed or removed by editing the following section:

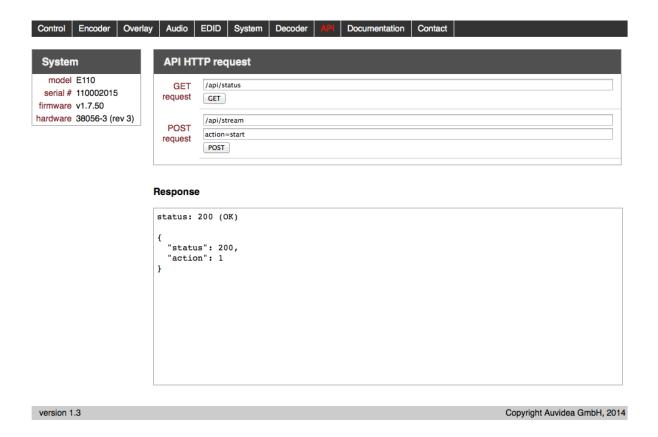

```
<div id="navigation">
 ul>
  <a href="javascript:showonlyone('content_control');" style="color:#E00;">Control</a>
  <a href="javascript:showonlyone('content_encoder');">Encoder</a>
  <a href="javascript:showonlyone('content_overlay');">Overlay</a>
  <a href="javascript:showonlyone('content_audio');">Audio</a>
  <a href="javascript:showonlyone('content_edid');">EDID</a>
  <a href="javascript:showonlyone('content_timer');">Timer</a>
  <a href="javascript:showonlyone('content_decoder');">Decoder</a>
  <a href="javascript:showonlyone('content_network');">Network</a>
  <a href="javascript:showonlyone('content_system');">System</a>
  <a href="javascript:showonlyone('content_api');">API</a>
  <a href="manual.pdf" target="_blank">Manual</a>
  <a href="http://www.auvidea.com" target="_blank">Contact</a>
 </div>
```

After you have made the changes, please move the www directory inside www_backup to the top level of the USB stick. Then press the copy button, to copy the contents of the www directory on the USB stick to the internal www directory.

API HTTP request

Web based API request form

In the web based GUI an API HTTP request form is integrated. This allows to issue custom GET and POST HTTP requests to the API. Just enter the API URL in the first field. For a POST request the mandatory POST string is required, which specifies the POST parameters.

Simple HTML example

The GET calls in the first section call a couple a sample API calls. The <form> element in the second section changes 2 "settings" parameters (width and height) by displaying a form with 2 input fields and a submit button, which assembles the POST string and sends it to the API interface. This example is included in the E110. Just open "http://<ip-address>/index-min.html" in a web browser window.

HTML page

HTML code

```
<h2>GET calls</h2>
<strong><a href="api/system">system</a>
<strong><a href="api/date">date</a></strong>
<strong><a href="api/date">date</a></strong>
<strong><a href="api/network">network</a></strong>
<strong><a href="api/settings">settings</a></strong>
<strong><a href="api/audio">audio</a></strong>
<strong><a href="api/input">input</a></strong>
<to>cp><strong><a href="api/input">input</a></strong>
<a href="api/input">input</a></strong>
<form name="post1" action="api/settings" method="post">width <input type="text" name="width">height <input type="text" name="height"><input type="text" name="height"><input type="submit" value="settings"></form>
```

```
{
  "status": 0,
  "width": 900,
  "height": 900,
  ..
}
```

status

GET get the system status (http://<ip-address>/api/status)

This API call is specifically designed to poll the system status in regular intervals and display it on the web page. The parameters "lost frames" and "fail frames" should always be 0. This indicates that the encoder performs properly.

Audio and video synchronization

"av sync drop and repeat" frames are video frames which are inserted or deleted to ensure that audio and video stay 100% in sync. The system master clock of the encoder is derived from the audio clock. As audio and video clocks are sometimes not locked to each other because they may be generated from 2 independent crystals, it is required, that audio and video frames are resynchronized in regular intervals. In the example below 13 frames were added in 674,000 frames, so roughly one frame every 50,000 frames (at 60 fps this is one frame every 15 minutes). This interval varies with the video and audio sources connected (typically: 10,000 .. 100,000 frames). With many HDMI sources the digital video and digital audio data are perfectly in sync, to no frames have to be deleted or added (no avsync operation).

Parameters (get)

```
mode
               0: encoder, 1: decoder
               0: no HDMI cable plugged in, 1: HDMI cable plugged in
cable
format
               video input format
digital
               0: analog audio in (line), 1: digital audio in (HDMI embedded audio)
stream
               0: not streaming, 1+: stream duration in seconds
               0: not recording, 1+: record duration in seconds
record
bitrate
               average bit rate, current bit rate, audio bit rate
frames
               frame rate, total frames, encoded frames, lost frames, fail frames, av sync drops, av sync repeats
live
               video bit rate, gop size, encoded video resolution (horizontal, vertical)
               0: off, -1: event pending, 1: stream, 2: record, 3: record & stream, 4: play
timer
time
               time interval until event start or event start (-1: infinite interval)
               status of the H.264 video encoder (off or on)
codec
USB
               name of the USB device (empty, if no device mounted)
               # of video files and # of images recorded
media
               name of the event
event

  "second": 46,
  "weekday": 5,
  "utcOffset": 0,
  "timeZone": "UTC"
}
```

date/ntp

GET get the ntp settings (http://<ip-address>/api/date/ntp)

POST set the ntp settings

Parameters (get and post)

```
action save, ntp_update save: permanently save settings
ntp_update: retrieve current date/time from ntp server

ntp server address default: pool.ntp.org
utcOffset -12 .. +12 set delta in hours to UTC
```

```
{
  "status": 200,
  "ntp": "pool.ntp.org",
  "utcOffset": 0
}
```

audio

GET get audio settings (http://<ip-address>/api/audio)

POST set audio properties

A switch from analog to digital audio and vice versa may only performed, while the encoder is not recording or streaming. The switch over time is approximately 6 seconds. If settings should be permanently saved, place the "action=save" parameter at the beginning of the post string. Only parameters after "action=save" are permanently saved.

Parameters (get and post)

```
action
                save: permanently save the settings
digital
                1: HDMI embedded audio, 0: analog audio
stereo
                1: stereo, 0: mono (left channel on left and right) (t.d.a.)
volLeft
                volume on left analog channel (-12 .. +20dB)
volRight
                volume on right analog channel (-12 .. +20dB)
muteLeft
                mute analog audio left channel (1: mute, 0: no mute)
muteRight
                mute analog audio right channel (1: mute, 0: no mute)
sample Rate
                analog sample rate (HDMI: set by HDMI input signal) (t.b.a.)
                headphone volume left channel (-68 .. +29dB)
hpLeft
hpRight
                headphone volume right channel (-68 .. +29dB)
                headphone mute left channel (1: mute, 0: no mute)
hpMuteLeft
                headphone mute right channel (1: mute, 0: no mute)
hpMuteRight
```

```
{
    "status": 200,
    "digital": 1,
    "volLeft": 0,
    "volRight": 0,
    "muteLeft": 0,
    "muteRight": 0,
    "hpLeft": -10,
    "hpRight": -10,
    "hpMuteLeft": 0,
    "hpMuteLeft": 0,
    "micBias": 0,
    "sampleRate": 48000,
    "stereo": 1
}
```

input

GET get the input timing of the HDMl input (http://<ip-address>/api/input)

POST set input properties

"colorInput" is the color code as received with the AVI info frame. Normally the HDMI receiver chip is set to the same "color" code. This setting may be manually overwritten (post).

Use action=save&color=x with x = 0,1 or 2 to set the initial color space. This avoids wrong colors with the initial video display.

Parameters (get and post)

cable	plugged: HDMI cable plugged into HDMI input
	unplugged: no HDMI cable plugged in
hpd	on: HPD line active (default), off: HPD line inactive (no video)
edid	remote: EDID readable (default), local: EDID blocked
format	video format of the HDMI input signal
active	video resolution (h, v)
total	resolution of the video container (h, v)
timing	h front porch, h width, h back porch, v front porch, v width, v back porch
interlaced	true or false
aviInfoframe	info frame received
color	color code overwrite (0: RGB, 1: YUV 4:2:2, 2: YUV 4:4:4) (get and post)
colorInput	color code as received in the AVI info frame
vic	video information code (0 127)
audioInfoframe	audio info frame received
msInfoframe	MS info frame received

```
"status": 200,
"cable": "plugged",

```

input/edid

GET get the EDID memory of the HDMI input of this system (http://<ip-address>/api/input/edid)

POST set the EDID memory of the HDMI input of this system with a custom EDID

Sample GET to read decimal EDID setting: http://<ip-address>/api/input/edid?format=1

Parameters (get)

format 0: read byte values in hexadecimal format (default)

1: read byte values in decimal format

base 128 byte base set

baseChecksum first number: calculated total sum, second number: calculated sum modulo 256 (checksum)

extended 128 byte extended set

extendedCheck. first number: calculated total sum, second number: calculated sum modulo 256 (checksum)

Parameters (post)

action save: permanently save the custom EDID

default: delete saved custom EDID and revert back to the factory default setting

base 128 byte base set (128 decimal values separated by ",")
extended 128 byte extended set (128 decimal values separated by ",")

Sample base POST string:

Please note that a valid base set must start with the sequence: 0,255,255,255,255,255,255,0. Numbers in hexadecimal format are not supported.

The last byte is the checksum byte (here: 159). All 128 bytes must add up to a multiple of 256 (here: 6912).

The range of each byte is: 0 .. 255.

"action=save" permanently saves the custom EDID in the file: /data/bin/edid.hex.

",action=default" reverts back to the factory default EDID setting.

Sample extended POST string:

extended=2,3,32,244,72,147,132,5,20,3,18,160,161,35,9,7,7,131,1,0,0,103,3,12,0,16,0,128,16,226,0,42,1,29,128,208,114,28,22,32,16,44,37,128,160,90,0,0,0,158,1,29,128,24,113,28,22,32,88,44,37,0,160,90,0,0,0,158,1,29,0,114,81,208,30,32,110,40,85,0,160,90,0,0,0,30,140,10,208,144,32,64,49,32,12,64,85,0,160,90,0,0,0,30,140,10,208,138,32,224,45,16,16,62,150,0,160,90,0,0,0,30,0,0,0,0,89

The last byte is the checksum byte (here: 89). All 128 bytes must add up to a multiple of 256 (here: 7424).

"extendedChecksum": [7424,0]
```

system

GET get the system properties (http://<ip-address>/api/system)

Please feel free to monitor the "freeMemory" parameter. If this parameter decreases over time and approaches 0, then the system has a memory leak problem. Please send us a bug report with as much information as possible, to that we can duplicate the problem and fix it. And we make sure that we punish the software developers.

Parameters (get)

model	model description
hostname	Linux hostname
serialNumber	serial number
macAddress	MAC address
firmware	version of the firmware (auvidea_enc)
software	software version of the system
hardware	hardware version of the system
linux	Linux version
freeMemory	memory available (typically between 5 and 15 MB)
systemUptime	uptime in seconds since last cold boot of the system
uptime	uptime of the firmware since the last restart
heartbeat	this value is incremented

Response

```
{
   "status": 200,
   "model": "Auvidea E110 H.264/AAC encoder/decoder",
   "hostname": "e110",
   "serialNumber": "110001014",
   "macAddress": "00:40:05:73:54:0E",
   "firmware": "v1.4",
   "version": "software release 1.4",
   "hardware": "38056-2",
   "linux": "2.6.30.mobi.merlin-mg3500.custom",
   "freeMemory": "12164kB",
   "systemUptime": 11320,
   "uptime": 567,
   "heartbeat": 6336
}
```

network

GET get the network properties (http://<ip-address>/api/network)

POST set the network properties

Network changes may be made temporarily (until the next boot) or permanently. For permanent changes please use the POST parameter "action=save". Only parameters after "action" are permanently saved. So "action" should be the first parameter in the POST string.

DHCP

Please use this parameter carefully, as this system has little means to communicate the dynamically assigned IP address. DHCP settings changes are active with the next reboot of the system. If "dhcp" is set to "1" without "action=save", then it will effect only the next reboot, and on the reboot after it will revert to "dhcp=0". Please use this scheme, to first try out DHCP. Please retrieve the IP address from the DCHP tables in your DHCP server (typically your router) or by inserting a USB stick at boot up time. Remove the stick when the boot has completed and open the startup.log file with a text editor. Also you will find a copy of the config file on the USB stick.

Parameters (get and post)

```
action
                save: permanently save the settings
                IP address
ip
subnet
                subnet mask
                gateway address
gateway
                DNS (domain name server) address
dns
                MAC address (get only)
mac
                1: DHCP active, 0: DHCP inactive
dhcp
RXbytes
                number of bytes received (Ethernet) (GET only)
TXbytes
                number of bytes transmitted (Ethernet) (GET only)
```

Response

```
{
   "status": 200,
   "ip": "192.168.0.167",
   "subnet": "255.255.255.0",
   "gateway": "192.168.0.1",
   "dns": "192.168.0.1",
   "mac": "00:40:05:73:55:3E",
   "dhcp": 0,
   "RXbytes": 920305,
   "TXbytes": 4271881
}
```

led

GET get the LED status (http://<ip-address>/api/led)

POST set the LED status

3 LEDs are located in the front of the board below the connectors as indicated below. "auto" is the default setting. Here the LEDs are controlled automatically. The rec LED lights up, when the system is recording. The stream LED lights up, when the system is streaming.

If the W100 is mounted on top, then the LEDs on the E1xx are disabled.

Parameters (get and post)

```
rec on, off or auto (red LED below USB connector)

stream on, off or auto (green LED below Ethernet connector)

power on, off or auto (red LED below front audio jack)

status on, off or auto (for E120 only)
```

```
{
  "status": 0,
  "rec": "auto",
  "stream": "auto",
  "power": "auto"
}
```

pwm

GET get the pam status (http://<ip-address>/api/pwm)

POST set the PWM parameters

The system features 3 PWM (pulse width modulation) outputs (PWM_0, PWM_1 and PWM_2 on expansion connector J23). The pulse width and the frequency may be set. On the WLAN module these signals control the 3 servos outputs. For standard servos the frequency should be 50 Hz. The pulse high time should vary from 0.5ms (servo=-1000) to 1.5ms (servo=+1000). For other applications the low time of the pulses may be specified directly. At 50 Hz the total low time is approx. 666,000 (timer ticks).

Parameters (get and post)

```
servo servo control from -1000 to +1000 (the low time is computed automatically)
frequency typically 50 Hz
low time of the pulses (in timer ticks)
```

Response

```
{
   "status": 200,
   "servo1": -500,
   "frequency1": 50,
   "lowtime1": 628500,
   "servo2": 0,
   "frequency2": 50,
   "lowtime2": 617000,
   "servo3": 1000,
   "frequency3": 50,
   "lowtime3": 594000
}
```

storage

GET get the properties of the USB device and SD card (http://<ip-address>/api/storage)

This system can either record video files to a USB memory stick or internal micro USB card. Please use "record", to select the target device for recording.

The internal flash memory stores various applications and system data as well as the www_root directory. If large amounts of data are copied to the www_root directory, then this parameter needs to be monitored.

Parameters (get)

```
power
                 on: power on (5V 500mA), off: power off
mounted
                 yes, no
                name of the storage media
name
path
                Linux mount path
                 fat (FAT32), ext (Linux formatting: ext2 or ext3)
filesystem
                 total size of the storage media
total
                 size size of the storage media
free
                 total: total size of internal flash memory, free: free size of internal flash memory
flash
                 size of the root partition
root
```

Parameters (post)

power	on	power on (5V 500mA) (default)
	off	power off

```
"status": 0,
"power": "on",
"usb": {
 "mounted": "yes",
 "name": "Intenso",
 "path": "/media/Intenso",
  "filesystem": "fat",
  "total": "1949 MB",
 "free": "328 MB"},
"sd": {
 "mounted": "yes",
 "name": "SDCARD8GB",
 "path": "/media/SDCARD8GB",
  "filesystem": "fat",
  "total": "7631 MB",
 "free": "7628 MB"},
"flash": {
 "total": "426 MB",
  "free": "418 MB"}",
"root": {
  "total": "79 MB",
  "free": "44 MB"}
```

settings

GET get the encoding settings (http://<ip-address>/api/settings)

POST set the encoding settings

It is recommended to keep the autosize property set, so that the encoding resolution is automatically configured. To scale the video before encoding or to configure video formats, which are not automatically detected, please set this property to 0. In this case all parameters may be manually configured.

JPEG preview

This features allows to push JPEG images onto a web page for preview purposes. The E110 creates an JPEG image every 2 seconds and overwrites the previous one, as all images are saved unter the same name: <www-root>/image.jpg.

Parameters (get and post)

action save: permanently save settings (e.g: action=save&fpsDivide=1)

width, height size of the video before scaling

hsize, vsize size of the video after scaling (modulo 16)

cropLeft cropping from left (must be even)

cropTop cropping fro top

hstart, vstart video positioning (typically: sync width plus back porch)

total total size of the storage media interlaced 1: interlaced, 0: progressive video

fpsDivide encoded frame rate is input frame rate / fps_divide
gop 0 .. 1000 (1: I-frame only, 1+: IP frames, 0: infinite size)
video 100 .. 10000: video bandwidth in kbps (2000 = 2 Mbit/s)
audio 32 .. 256: audio bandwidth in kbps (128 = 128 kbit/s)

profile base, main, or high

av 0: audio and video, 1: video only, 2: audio only (t.b.a.)

autosize 1: determine encoding resolution from detected video format, 0: manual configuration

swapUV 1: swap Cr and Cb color channels (swap red and blue), 0: normal operation

name of the RTSP stream

port port of the RTSP stream (default: 554)

udphostname target IP address, the UDP stream is pushed to (video only, no audio)

udpport UDP port (default: 5000)

videostreamid ID of the video stream (default: 2) audiostreamid ID of the audio stream (default: 1) jpgQuality quality of the JPEG images (0 .. 100)

preview 0: no JPEG preview, 1: a JPEG preview image is created every 2 seconds (/tmp/image.jpg)

encoder mode: base, safe and advanced

```
"status": 200,
"width": 1920,
"height": 1080,
"hsize": 1920,
"vsize": 1080,
"cropLeft": 0,
"cropTop": 0,
"hstart": 191,
"vstart": 30,
"aspect": [1,1],
"fps": 60,
"interlaced": 1,
"fieldOffset": 563,
"fpsDivide": 1,
"gop": 30,
"video": 2000,
 "audio": 128,
 "profile": "high",
"av": 0,
"autosize": 0,
"swapUV": 0,
"protocol": "rtsp",
 "name": "stream",
 "port": 554,
 "udphostname": "192.168.0.100",
"udpport": 5000,
"videostreamid": 2,
"audiostreamid": 1,
"jpgQuality": 50,
"preview": 0,
 "encoder": "advanced"
```

stream

GET get the stream status (http://<ip-address>/api/stream)

POST set the encoding settings

The system supports RTSP live streaming to a local player (such as a VLC player) and a local server (such as a Wowza server). Some parameters may may changed while streaming or recording, to adjust the bandwidth output of the encoder to the bandwidth available on the communications link. However, it is not recommended to change the resolution of the video, while encoding. Players do not accept a live change of the video resolution. Please restart the player.

Alternatively a UDP stream may be pushed. This only supports a video stream at this time. No audio.

Parameters (get)

stream	streaming, stopped
startTime	start time of streaming
address	address of the live stream

Parameters (post)

```
action start, stop
video 100 .. 15000: change the video bandwidth while streaming or while recording
gop 1 .. 1000: change the top size while streaming or recording
hsize, vsize change the encoding size while streaming or recording (for experimental use only)
```

Response

```
{
   "status": 200,
   "action": 0,
   "stream": "streaming",
   "startTime": 11518,
   "address": "rtsp://192.168.0.160:554/stream"
}
```

record

GET get the record status (http://<ip-address>/api/record)

POST set the record settings

Some recording parameters (gop and video bandwidth) may may changed while streaming or recording. Please use the "stream" call, to adjust these two settings.

The firmware manages the recording when the maximum file size is reached. Recording is stopped and automatically restarted with a new file name. When the free space on the media falls below minfreespace, then recording stops permanently.

Parameters (get)

```
record
                recording, stopped
startTime
                start time of recording
isoStartTime
                start time and date in ISO format
duration
                recording time in seconds
file
                video file name and path
                total number of frames recorded
frames
lost
                number of frames lost (this should stay 0)
device
                target recording device (USB or SD)
```

Parameters (post)

```
action start, stop

device USB, SD

maxfilesize maximum file size in Mbyte (4096MB is max for .mp4 files)

minfreespace stop recording if free space falls below this value (in Mbytes)
```

Response (get)

```
{
  "status": 200,
  "record": "recording",
  "startTime": 406,
  "isoStartTime": "1970-01-01T00:06:47+0000",
  "duration": 30,
  "file": "/data/media/TEST/video_test12/video-1.mp4",
  "device": "USB",
  "maxfilesize": 4050,
  "minFreeSpace": 40
```

Response (post)

```
"status": 10,
"record": "recording",
"comment": "recording started",
"device": "USB"
}
```

statistics

GET get the encoding statistics (http://<ip-address>/api/statistics)

If recording is active and fail_frames is not zero, some frames could not be written to the recording device. This is an indication, that the memory device being recorded to is not fast enough. Please ensure that a video class 6 or better device (SD card in USB card reader) is used, as these are optimized for recording applications. Most USB memory sticks have low sustained write rates, as sometimes they are busy with internal housekeeping tasks at certain times.

Encoded_frames vs. total_frames: if FPS_DIVIDE is greater than 1, then the video is encoded at a reduced frame rate. Consequently the number of encoded frames is lower than the number of total frames.

Audio and video synchronization

Frames are inserted or deleted to keep the video in sync with the audio. Please see /api/status for details.

Parameters (get)

```
videoRitrate
                average video bitrate (kbit/s)
videoCurBitrate current video biter ate (kbit/s)
audioBitrate
                average audio nitrate (kbit/s)
frameRate
                encoded frame rate (fps)
totalFrames
                total frames captured (at video frame rate)
encodedFrames number of frames encoded
failFrames
                number of frames failed (should be 0 for normal encoding)
avsyncFrames
                drop/repeat frames: inserted/deleted frames, to ensure that audio and video stay in sync
encoderSize
                encoded video resolution (horizontal, vertical)
encoderLoad
                hardware and software load of the encoder in percent (here: HW 510% and SW 10%)
```

Response

```
{
   "status": 200,
   "videoBitrate": 1848,
   "videoCurBitrate": 1520,
   "audioBitrate": 151,
   "frameRate": "60.0",
   "totalFrames": 693554,
   "encodedFrames": 693382,
   "failFrames": [0,0],
   "avsyncFrames": [0,13],
   "encoderSize": [1280,736],
   "encoderLoad": [51,10]
}
```

recordings

GET get the file list of the recorded video files (http://<ip-address>/api/recordings)

POST delete one video file, which has been recorded

Switch from USB to SD with the "record" => "device" parameter.

Parameters (get & post)

```
device target recording device (USB or SD) (get)
recording list of file names of the recordings (get)
number number of video files recorded (get)
delete delete one video file (post)
```

Response

```
{
  "status": 0,
  "device": "USB",
  "recordings": [
    [ 1,  "/media/Intenso/video_2014-04-11_13-30-25"],
    [ 2,  "/media/Intenso/video_2014-04-11_15-20-00"],
    [ 3,  "/media/Intenso/video_2014-04-12_11-49-34"],
    [ 4,  "/media/Intenso/video_2014-04-12_14-00-15"]
],
    "number": 4
}
```

Post error codes

```
406 video file is being recorded (please stop recording first)
407 bad directory path
408 no USB device name
409 no USB device
410 video file path not valid
```

GET request issued simply with the URL (Safari browser on Mac OS 10.9)

timer

GET get the timer status (http://<ip-address>/api/timer)

POST set the timer settings

Schedule a recording or streaming event. Minimum duration: 60 seconds. Set duration to 0, to create an event of infinite length.

Auto start of system

Set "time" to a time in the past. Best set it to time=0 (1970-01-01 0:00), as this is the time the system is set to, if there is no access to the ntp server. Set duration to 0. Alternatively to an extremely large number (e.g. 2,000,000,000). Then select the mode, the system should auto start with. This will set the auto start mode. Please make sure, to use the "action=save" parameter, so that these settings are saved in the config file for permanent save. "action=save" mud be the first parameter in the post string, as only parameters after the "action=save" are saved permanently.

Parameters (get and post)

```
action
                 save: save settings permanently
time
                 record or stream start time
ISO_time
                 record or stream start time in ISO format
duration
                 duration of the event - in seconds (60: minimum, 0: infinite)
mode
                 0: off, 1: stream, 2: record, 3: record & stream, 4: play
startIn
                 time interval in seconds, until timer event will start
remaining
                 time interval in seconds, until timer event will stop
                 1: recording in progress (started by timer)
recording
streaming
                 1: streaming in progress (started by timer)
                 1: playing in progress (started by timer)
playing
active
                 1: timer has started streaming, recording or playing
                 1: timer pending (recording, streaming or playing will start at "time")
pending
                 -1: idle, 0: completed, 1 .. 8: record could not start, 10: record started
result
```

```
"status": 200,
"time": 1405955220,
"isoTime": "2014-07-21T15:07:00",
"vear": 2014.
"month": 7,
"day": 21,
"hour": 15,
"minute": 7,
"second": 0,
"duration": 1000,
"mode": 1.
"startIn": 84591,
"remaining": 0,
"recording": 0,
"streaming": 0,
"playing": 0,
"active": 0,
"pending": 1,
"result": -1
```

play

GET get the play properties (http://<ip-address>/api/play)

POST set the play properties

"play" can decode an RTSP video stream and play it out on the HDMI output port.

Note: the E110 can easily switch from encode (record and stream) to decode (play) mode, but it cannot switch back from decode to encode. To switch back the E110 needs to be powered down and up again (cold reboot). If the decoder does not receive a video stream, it will show show a blue screen. If the stream got interrupted, the decoder will sense this and restart, waiting for the stream to continue. In this state, it will also show a blue screen.

Parameters (get and post)

play status: playing or not playing startTime start time of recording isoStartTime start time and date in ISO format duration recording time in seconds address IP address of the RTSP video encoder stream name of the RTSP stream name video video resolution: 720p50, 720p60, 1080i25, or 1080i30 (1080i 50 and 60 fps) format rtsp av 0: audio and video, 1: video only ntsc pixel clock: 0: 74.25MHz (25/30/50/60Hz), 1: 74.17MHz (29.97/59.94Hz) sampleRate audio sample rate (e.g. 48000) timeoutStreamLoss timeout for stream loss - after this encoder is restarted and will wait for stream timeout NoStream timeout for no stream - play was started, but no stream was received - after this interval the encoder will be restarted (this may be set to large number)

Parameters (post)

action	start	start the play of an RTSP stream
	stop	stop the play of an RTSP stream
	save	permanently save the settings

```
"status": 200,
"state": 1,
"play": "playing",
"startTime": 1407332537,
"isoStartTime": "2014-08-06T13:42:17+0000",
"duration": 193,
"address": "192.168.0.165",
"name": "stream",
"video": "720p50",
"format": "rtsp",
"av": 0,
"ntsc": 0,
"sampleRate": 48000,
"timeoutStreamLoss": 1,
"timeoutNoStream": 50
}
```

playStatistics

GET get the play statistics (http://<ip-address>/api/playStatistics)

Parameters (get)

state 0: waiting for stream, 1: playing, 2: stream ended, 3: stopped videoBitrate average video bit rate (kbit/s) current video bit rate (kbit/s) frameRate video frame rate (fps) decodedFrames number of video frames decoded number of audio frames decoded receivedFrames number of total video frames received number of video frames dropped number of video frames repeated number of video underflows clocks video pixel clock (Hz) audio sample rate (Hz) decoderLoad hardware load of the decoder (%) software load of the decoder (%)

Response

```
{
   "status": 200,
   "state": 0,
   "videoBitrate": [1960,1943],
   "frameRate": "49.9",
   "decodedFrames": [37737,35402],
   "receivedFrames": [37736,7,0,0],
   "clocks": [74250000,48000],
   "decoderLoad": [22,2]
}
```

37

output

GET get the properties of the HDMl output (http://<ip-address>/api/output)

POST set the color mode of the HDMI output

Recommendation: for most applications leave "color" in the default setting for true loop through, as the HDMI output will have the same color model as the HDMI input. For debugging purposes the HDMI output may be connected to the HDMI input. This allows to read the EDID of the HDMI input and the HPD output line of the HDMI input.

Parameters (get)

power	on: enable 5V 500mA on HDMI output, off: enable 5V 55mA on HDMI output
hpd	on: HPD input line active, off: HPD input line inactive
vic	vic code in the AVI info frames, which are send out to the monitor (mirrored from input)
color	color code of the HDMI output
colorInput	color code of the HDMI input (AVI info frame of HDMI input)
total	total resolution of the video put out (this should match the input resolution)

Parameters (post)

power	on	high power mode (5V 500mA)
	off	low power mode (5V 55mA)
color	0	set HDMI out to RGB (HDMI encoders)
	1	set HDMI output to YUV 4:2:2
	2	set HDMI output to YUV 4:4:4
	3	the HDMI output automatically follows the HDMI input color mode (default)

```
{
   "status": 200,
   "power": "on",
   "hpd": "on",
   "vic": 4,
   "color": 3,
   "colorInput": 2,
   "total": [ 1650, 750 ]
}
```

output/edid

GET get the EDID memory of the monitor, which is connected to the HDMI output in the back (http://<ip-address>/api/output/edid)

This command is only available for HDMI models.

Parameters (get)

```
base 128 byte base set
extended 128 byte extended set
```

```
"status": 200,
"base": [
            "0x00", "0xff", "0xff", "0xff", "0xff", "0xff", "0xff", "0xff", "0x00",

WWW

GET get the www root directory content (http://<ip-address>/api/www)

POST modify the content of the www root directory

This functions to manage the directory content of the www_root directory. There should not be a subdirectory named "api", as this might collide with the API calls.

Please use the "clear" option carefully, as the complete www_root directory is wiped out. On the next system restart the logical link to the image.jpg file in the ramdisk (/tmp) is automatically restored (image.jpg -> /tmp/image.jpg). Please note that a "clear" also deletes the web GUI. So please backup these files first.

Parameters (post)

```
action clear empty the www_root directory (delete all files)
copy copy files from "<usb device>/www" to www_root
backup copy files from www_root to "<usb device>/backup/www"
```

Response (get)

```
"status": 200,
"www root": [
           16 Jan 1 00:01 capture.jpg -> /tmp/capture.jpg",
       73896 May 13 2015 functions-admin.js",
       40808 May 13 2015 functions.js",

 1
```

upgrade

POST upgrade control (http://<ip-address>/api/upgrade)

The firmware and software may be upgraded by supplying a special upgrade file on a USB memory device. Please unzip the file first. The upgrade should only take a few seconds. After the upgrade completed please do a cold boot.

The models without USB port must be upgraded by FTP. Please upload the unzipped file with your FTP client (e.g.Filezilla) to the encoder. Username: ftp, password: ftp. Perform the upgrade with this API call. On completion please delete the upgrade file from the FTP directory, to save space in Flash memory.

Parameters (post)

file	<filename></filename>	name of the upgrade file on USB memory device
action	restart	warm boot the new firmware
source	ftp or usb	location of the upgrade file

Response (status)

status	0	upgrade successful (plus version and message are shown) file not found
	2	illegal upgrade file
	3	restart illegal, as system is recording or streaming
	4	restart initiated

```
{
  "status": 0,
  "version": "software 1.9",
  "message": "upgrade successful"
}
```

log

GET get API call log (http://<ip-address>/api/log)

POST set logging settings

Parameters (post)

action	start	start logging API calls
	stop	stop logging (default)
	clear	clear entire log
autoclear	on	automatically delete entire log once 100 calls have been logged
	off	stop after logging 100 calls (default)

Response

```
{
  "status": 200,
  "quantity": 5,
  "log": [
     [ 1, "GET ", "/api/system", "", 0 ],
     [ 2, "GET ", "/api/network", "", 0 ],
     [ 3, "GET ", "/api/settings", "", 0 ],
     [ 4, "POST", "/api/settings", "port=554&name=teststream", 24 ],
     [ 5, "GET ", "/api/log", "", 0 ]
     ]
}
```

Also there is a log of system messages. Please get with the http://<ip-address>/log call. Example:

HTTP page

```
# uptime err description
1 513 200 system.log moved to /data/media/TEST/video_test12 and cleared
2 522 200 recording started: video path: /data/media/TEST/video_test12, USB free space 6943
```

text overlay (OSD)

POST set text overlay parameters (http://<ip-address>/api/text)

Up to 8 text strings with up to 24 characters each may be instantiated. The position of each string may be specified with the following restriction: the horizontal position must be a multiple of 64, the vertical position must be a multiple of 16.

Sample POST string: enable=1&index=2&x=900&y=96&text=sample text overlay

The horizontal and vertical position is automatically adjusted to the nearest legitimate value.

Parameters (post)

```
enable 0: text overlay disabled, 1: text overlay enabled index 0 .. 7: index of the text string font 8, 16 or 32: font size (8x8, 16x16, or 32x32) x horizontal position y vertical position text overlay text string (up to 24 characters)
```

```
{
  "status": 200,
  "enable": 1,
  "index": 2,
  "font": 16,
  "x": 896,
  "y": 96,
  "text": "sample text overlay",
  "length": 19
}
```

timestamp overlay

POST set timestamp overlay parameters (http://<ip-address>/api/timestamp)

One timestamp with 22 characters may be instantiated. The position of the timestamp overlay may be specified with the following restriction: the horizontal position must be a multiple of 64, the vertical position must be a multiple of 16.

Sample timestamp string: 2014-06-19 13:59:40:20

The last number is the frame counter.

Sample POST string: enable=1&index=1&x=128&y=16&font=16

The horizontal and vertical position is automatically adjusted to the nearest legitimate value.

Parameters (post)

```
enable 0: text overlay disabled, 1: text overlay enabled
index 0 .. 7: index of the text string
font 8, 16 or 32: font size (8x8, 16x16, or 32x32)
x horizontal position
y vertical position
```

```
{
  "status": 200,
  "enable": 1,
  "index": 1,
  "font": 16,
  "x": 128,
  "y": 16
}
```

timeout

POST admin control (http://<ip-address>/api/timeout)

The E110 features a software watchdog, which may be enabled to guarantee a reliable 24/7 operation. The watchdog is automatically kicked by the E110 firmware. If the firmware stops kicking the watchdog and it times out after the preset time, the firmware and any encoding or decoding processes are restarted. For a true hardware reset watchdog please use the 38116 GPIO add-on board.

On timeout the auvidea_enc is terminated, as it has started the watchdog process. If the auvidea_enc process cannot be terminated, then Linux will reboot. When the auvidea_enc process is terminated, the 99init script will restart this process in an endless while loop.

Parameters (get and post)

```
action save: permanently save the timeout settings

timeoutEnable 0: stop timeout feature

1: start timeout feature

timeoutCount time period until the timeout process times out (5 .. 10000 seconds)

0: normal operation

1: stop kicking the timeout process, to force a timeout (no permanent save of this option)
```

```
{
  "status": 200,
  "timeoutEnable": 1,
  "timeoutCount": 45,
  "timeoutTest": 0
}
```

rs232

GET get status of RS232 port (http://<ip-address>/api/rs232)

POST send data out on the RS232 port (http://<ip-address>/api/rs232)

The E110 can send and receive data on the RS232 to control a block camera or other devices.

Get configuration of serial ports

A GET request with /api/rs232 reads the configuration of the serial ports. The default port parameter is the serial port, which is used if no specific is addressed with a POST command.

Parameters (get)

```
default default port for rs232 access

1: ttyS1
2: ttyS2

ttyS1, ttyS2 6 values are returned
1: active or inactive (state of port)
2: baudrate (300 .. 115200)
3: number of stop bits
4: number of data bits
5: parity (0: odd, 1: even)
6: parity ("y": yes, "n": no)
```

Response

```
{
    "status": 200,
    "default": 1,
    "ttyS1": ["active", 38400, 1, 8, 1, "n"],
    "ttyS2": ["active", 38400, 1, 8, 1, "n"]
}
```

Set configuration of serial ports

A POST request with /api/rs232 modifies the configuration of the serial ports. "x" is the placeholder for the port number (1 or 2).

Parameters (post)

```
action
                 save - permanently save settings
default
                 default port for rs232 access
                 1: ttyS1, 2: ttyS2
ttySx
                 0: inactive, 1: active
baudrateSx
                 configure baudrate of tty$1 or tty$2 (300 .. 115200)
stopbitSx
                 set number of stop bits (1 or 2)
charsizeSx
                 set size of data field (5 to 8 bits)
paritySxeven
                 set parity to odd (0) or even (1)
partySx
                 enable (y) or disable (n) parity
```

POST: action=save&baudrateS1=19200

Response

```
{
    "status": 200,
    "action": "set baudrate of ttyS1 to 19200"
}
```

Transmit and receive data via serial ports

There are 2 modes:

- 1. Panasonic block camera mode: in this mode the last two bytes to be send to the camera are automatically appended. The first byte is the checksum of the data packet. The last byte is always 255 (0xFF) to terminate the data packet. The firmware then waits for the acknowledge (250) and any data returned by the camera. This is the default mode of the RS232 interface.
- 2. Sony block camera mode: in this mode no data is automatically appended. The mode has been tested with the Sony FCB-SE600 small block camera.

Please adjust the com port settings to meet the requirements of your camera. Please test these settings with the camera tab in the web GUI. If no supported camera is detected, then the following data will be displayed:

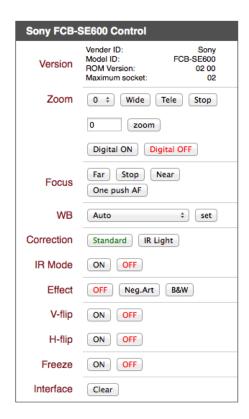

No camera detected!

- 1. Please connect a supported camera:
 - Sony FCB
 - Panasonic GP-MH3xx
- 2. Check serial port settings.
- 3. Relaod the page.

hardware	38117	38117-x
default port	1	2

camera	Sony FCB	Panasonic GP-MH3xx
	9600 (default) 19200 38400	2400
		4800
baudrate		9600
baddiate		19200
		38400
		(default)
stop bit	1	1
data length	8	8
parity	no	no

If the camera is detected correctly the camera tab will present the control page for the detected camera model. Here a Sony FCB-SE600 was detected.

Example: set vertical flip

POST: mode=sony&data=129,1,4,102,2,255

Parameters (post)

mode	pan or sony
data	sequence of decimal values which are sent to the camera
	value range: 0 255
count	number of data values received
ack	first response of camera
	first: number of bytes received from camera (e.g. "3")
	next: decimal values of bytes received (e.g. "144,65,255")
	last value is the latency ("45ms")
completion	second response of camera
	first: number of bytes received from camera (e.g. "3")
	next: decimal values of bytes received (e.g. "144,81,255")
	last value is the latency ("30ms")

Request (POST)

http://192.168.0.162/api/rs232 mode=sony&data=129,1,4,102,2,255

Response

```
{
    "status": 200,
    "command": "RS232 write data",
    "count": 6,
    "ack": [3,144,65,255,"28ms"],
    "completion": [3,144,81,255,"0ms"]
}
```

Now a sample request to a Panasonic camera. This sets the day/night parameter to color.

Request (POST)

```
http://192.168.0.167/api/rs232
mode=pan&data=160,40,0
```

Response

```
{
    "status": 200,
    "command": "RS232 write data",
    "count": 3,
    "reply": [1,250,"28ms"]
}
```

Last there is a raw mode. It writes a sequence of bytes to the com port output. After it waits a certain time for data being returned. It reads data until timeout expires or until it receives the end sign character, whatever happens first.

Parameters (post)

```
data sequence of values to be put out (comma separated list of decimal values - 0 .. 255)
timeout timeout in milliseconds
endsign terminating value (decimal number: 0 .. 255)
port 1 or 2 - the com port to be used (tty$1 or tty$2) - default is the default port
read read data from the serial port. 3 parameters may be provided:
1: number of bytes to be read
2: endsign to be checked for (this terminates the read)
3: timeout in milliseconds
```

Request (POST)

```
http://192.168.0.167/api/rs232
timeout=10&data=129,1,4,102,2,255
```

Response

```
{
   "status": 200,
   "action": "set timeout to 10",
   "command": "RS232 write data",
   "count": 6,
   "reply": [0,"0ms"]
}
```

After a write to the com port, data in the receive buffer may be read. This example was performed with the Sony FCB-SE600 connected. Is just uses the raw mode. This allows to read the messages of the Sony camera separately.

Request (POST)

```
http://192.168.0.167/api/rs232
timeout=10&data=129,1,4,102,2,255
```

Response

```
{
   "status": 200,
   "action": "set timeout to 10",
   "command": "RS232 write data",
   "count": 6,
   "reply": [0,"0ms"]
}
```

Now the first 4 bytes are read.

Request (POST)

```
http://192.168.0.167/api/rs232
read=4,,100
```

Response

```
{
    "status": 200,
    "port": "ttyS1",
    "read": [4,144,65,255,144,"0ms"]
}
```

Next, lets get the remaining 2 bytes. Now it returns the last 2 bytes and waits for more data, until the timeout period has expired.

Request (POST)

```
http://192.168.0.167/api/rs232
read=4,,100
```

```
{
  "status": 200,
  "port": "ttyS1",
  "read": [2,81,255,"100ms"]
}
```

GPIO add-on module (38116-2)

POST admin control (http://<ip-address>/api/addon)

This add-on module features a micro-controller, which implements various UI and monitoring functions. 4 switches are monitored. 4 LEDs are controlled. A hardware watchdog monitors the operation of the E110 firmware. Should the E110 stop kicking the watchdog (I2C write access to register 8 with a dummy data byte), then the micro controller will time out after a predefined time and assert a hardware reset to the E110. This action is flagged by the LED (D3). It will be on for 5 seconds. Normally it blinks, which indicates that the microc ontroller is operating normally.

Parameters (get)

```
action
                save: permanently save the watchdog settings (post only)
model
                model number of the add-on module
firmware
                firmware version of the micro controller on the add-on module
time
                real time clock (reset on each power up) - RTC still to be implemented
buttons
                record, stream, JPEG, and misc (1: button currently pressed)
temperature
                temperature in Celsius of the temp sensor on the GPIO module
                main input voltage (typical: 12V)
dcInput
dc3V3
                internal 3.3V power supply
dc1V8
                internal 1.8V power supply
dcAin
                external analog input (P14 pin 1)
watchdogEnable 0: watchdog disabled, 1: watchdog enabled (get and post)
watchdogCount time until the watchdog times out (5 .. 255 seconds) (get and post)
                0: normal operation, 1: stop kicking watchdog (for test purposes) (get and post)
watchdogTest
```

```
{
   "status": 200,
   "model": "38116-2 GPIO module",
   "firmware": 16,
   "time": 4927,
   "buttons": [0,0,0,0],
   "temperature": "35.8C",
   "dcInput": "11.8V",
   "dc3P3": "3.30V",
   "dc1P8": "1.78V",
   "dcAin": "0.0V",
   "watchdogEnable": 1,
   "watchdogCount": 248,
   "watchdogTest": 0
}
```

admin

POST admin control (http://<ip-address>/api/admin)

This admin interface is password protected, to protect the system. A system specific password may be requested. Please see the chapter "System Control" for details.

Parameters (post)

password	XXXX	
action	startSSH	start the SSH server for root level access
	stopSSH	stop the SSH server (default setting)
	getPS	retrieve the process list
	restart	restart the audio/video encoder (this resets the frame counters and re-
		initializes all encoding parameters) - no password protection
		(note: it does not restart the firmware)

FAQ

1. E110 shows an initial video with wrong colors

During bootup the color space need to be changed. Please use the API call: /api/input with POST action=save&color=x where x = 0, 1 or 2.
